

wordcount in hive:

hadoop is fun
fun with hadoop
Solution:

1. Load the wordcount txt file in hdfs.
2. create table wordtable(line string);
3. load data of wordcount txt file in wordtable
4. select * from wordtable;
5. SELECT (split(line, ' ')) AS word FROM wordtable;
6. select word,count(*) as count from
(SELECT explode(split(line, ' ')) AS word FROM wordtable)tempTable
group by word;

Explanation of 4th command:

- 1.Convert sentence into words

first we have to convert that it into words applying space as delimiter.we have to use split function of hive.

split (sentence , ' ')

- 2.Convert column into rows

hadoop is fun

Now we have array of strings like this

[hadoop,is,fun,fun,with,hadoop]

but we have to convert it into multiple rows like below

hadoop

is

fun

that is we have to convert every line of data into multiple rows ,for this we have function called explode in hive and this is also called table generating function.

SELECT explode(split(line, ' ')) AS word FROM wordtable;

```
explode(hadoop ,is,fun)
hadoop
is
fun
fun
with
hadoop
```

and create above output as intermediate table.

```
(SELECT explode(split(line, ' ')) AS word FROM wordtable)tempTable
```

after second step you should get output like below

```
word
hadoop
is
fun
fun
with
hadoop
```

```
hadoop: {hadoop}{haoop}
is:is
fun:{fun}{fun}
with:{with}
3.Apply group by
```

we have to apply group by to count word occurrences.

```
select word,count(*) as count from
(SELECT explode(split(line, ' ')) AS word FROM wordtable)tempTable
group by word;
```
